The sequences given in AAT58071-85 represent oligonucleotides which are
                                                                                                                                                                                                                                                                                                                  Gaps
              transcript of human intercellular adhesion molecule-1 (ICAM-1). These oligonucleotides may be used for treating septic shock and the manifestations of septic shock, e.g. inflammation, and vascular and rissue defects. They are also useful in the treatment of septic shock associated diseases, e.g. adult respiratory distress syndrome,

Sequences were determined from the ends of chromosome 11-specific cosmids by automated sequencing without intermediate subcloning.
A sample of 371 DNA sequence fragments were determined and of these, 277 were suitable for STS primer prediction by computer these, 277 were mapped by in situ hybridisation, somatic cell hybrid analysis (using the "primer" program available from E.Lander, MIT).
The STSS and cosmids were mapped by in situ hybridisation, somatic cell hybrid analysis to both. Using this method, 370 STSS specific for human chromosome 11 were generated and most of them were regionally mapped. This procedure illustrates a novel method for sequencing complex genomes, designated "sequence sampled mapping method is useful for the completion of high dennisty sequence—based maps, and ultimately, for the complete sequencing of genomic DNA directly from cosmid clones.
See AAQ82001-Q82706 and AAQ91325-Q91358 for STS primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Pathogen; yeast; intergenic spacer region; IGS1; PCR primer; probe;

It can be used to inhibit expression of these proteins forms the basis for treatment of conditions and diseases that have an inflammatory component, e.g. acne, psoriasis, arthritis, organ rejection, wounds, burns, septic shock or inflammatory complications of septic shock.

                                                         The present invention describes an assemblage comprising two primers, each of which can be used to amplify the intergenic spacer region IGS1 from one of various strains of the yeast Cryptococcus neoformans. A number of primers and probes are provided, as are the sequences of the IGS1 for 91 C. neoformans strains. This is useful in the discrimination of pathogenic yeasts, and the sequences can be used to construct a database having the same purpose. The present sequence is a probe or
comprises two universal primers adapted for nucleic acid amplification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer 5 and primer 6 (see AAV28524) are designed to amplify a 481 nucleotide DNA fragment initiating 265 nucleotides upstream of the polyA tail of RNA2 of a blackcurrant reversion vitus (BRV) Finnish isolate genome (see AAV28525). They were used with primer 1,2 (see AAV28521-22), designed to amplify a 210 nucleotide fragment, to detect different isolates of BRV originating from widely different geographic locations. Primer pair 1,2 amplified the expected virus-specific fragments from all tested virus isolates, and the primer pair 5,6 amplified the expected virus isolates, and the nearly all the tested virus isolates, indicating that the viral
                                                                                                                                                                                                                                                                                                                                                                                                                                        Blackcurrant reversion disease; BRV; rna2; diagnosis; Ribes; PCR;

PCR using these primers provides specific and sensitive detection of human ST receptor expression. A specific primer pair comprises the primers given in AAT99528 and AAT9952. Claimer pair comprises the primers given in AAT9952. Claimed in vitro methods for determining whether or not (i) an individual has metastasised colorectal cancer cells, or (ii) a tumour cell is a colorectal cancer cell comprise the steps of examining a sample of extraintestinal tissue and/or body fluids or tumour cells from an individual to determine whether ST Expression is determined by immunoassay or by PCR using primers that selectively amplify ST receptor CDNA or mRNA (see also
                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Determining whether an individual has metastasised colorectal cancer cells and origin of tumour cells - by detecting presence of heat-stable toxin receptor on cells in a sample
sequences detecting by these primer pairs are well conserved in all 1solates, including the common (E) and strong (R) forms of the reversion disease. The invention provides methods and kits for the diagnosis of blackcurrant reversion disease using RT-PCR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ; heat stable toxin receptor; colorectal cancer; tumour; diagnosis; human; PCR; primer; ss.

The components may be present in cis (in a single agent) or in trans (in separate agents).

The system is used for production of AAV vectors, particularly for gene therapy. The foreign DNA may encode a therapeutic protein, e.g. interferon, interleukin, growth factor, coagulation factor or metabolic enzyme, particularly one that increases the immunogenicity of tumour cells, and/or a diagnostic protein. The system produces AAV vectors on a large scale. It is based on the discovery that the rep68 and 78 proteins interfere with replication of AAV DNA, and that this interference is overcome by delaying

detector oligonuclectied of the invention. The detector oligonuclectied of the invention. The detector oligonuclectied of the invention. The detector oligonuclectied comprises a single-stranded target-binding region and an intramolecularly base-paired secondary structure linked to two dyes (donor and acceptor fluorophores). In the secondary structure, fluorescence of the donor is quenched, but when it is linearised or unfolded a change in some fluorescence parameter becomes detectable. A target nucleic acid is detected by hybridizing it to a detecteor oligonuclectide in which the secondary structure is 5' to the target binding region, primer extension to produce a complementary strand using the secondary structure as template, resulting in linearization or unfolding of it and detecting a change in fluorescence. The detector oligonuclectide are used to detect (by primer extension and hybridization) and amplify (as signal primer) target sequences, e.g. for

Sequences AAA72437, AAA72449-A72461, AAA72468 and AAA72474-A72477

represent cDNAs encoding novel plant isoflavone synthases (AAB21052 and AAB21071). Also discibsed is the soybean cytcohrone P450

concoxygenase CYP93C1, encoded by a known sequence (AAA7444, NCBI No. 2799005), which was identified in the present invention as having isoflavone synthase earlivity. The invention also relates to expression constructs, transformed host cells, and transgenic plants and seeds conscribing the novel cDNA sequences of the invention. The invention also encompasses methods of altering isoflavone synthase expression in a host cell, altering isoflavoned in a pint, and identifying nucleic acids encoding other plant isoflavone synthases. Isoflavone synthase catalyses cell, altering isoflavonoid levels in a plant, and identifying nucleic acids encoding other plant isoflavone synthases. Isoflavone synthase catalyses cells as Ney Toll in the biosynthesis of isoflavonoids. Isoflavonoids are catas of secondary metabolites mainly produced in leguminous plants by a branch of the phenylpropanoid pathway. Isoflavone synthase catalyses the first step in the branch of this pathway that commits metabolic intermediates to the synthesis of isoflavonoids. Isoflavonoids

consumption of legumes and rhizobial bacteria which eventually result in nodulation and nitrogen fixation. They have also been shown to act as artibiotics, repellents, attractants, and signal compounds, and consumption of legume isoflavonoids synthases, and nucleic acids encoding them, are useful for altering the levels of isoflavonoids produced in legumes such as soybean, and for the production of isoflavonoids in them, are useful for altering the levels of isoflavonoids produced in legumes such as soybean, and for the production of isoflavonoids cannot begunes and haltering the levels of isoflavonoids produced in legumes such as soybean, and for the production of isoflavonoids cannotic cannotification of the invention to ampility DNA encoding synthases.
                                                                                                                                                                                                                                                                                                                                        Nucleic acids encoding isoflavonoid synthases, useful for producing transgenic plants with increased production of isoflavonoids which are involved in defense against phytopathogenic microorganisms -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 11.4; DB 21; Length 25;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30 nucleobases in length that are capable of inhibiting the expression of anotheronal pyruvate carboxykinase-cytosolic (PEPCK cytosolic). The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               present sequence is one of a number of antisense compounds of up to

AAT ANT37933-T37946 represent the intron/exon boundaries for the human vascular endothelial growth factor (VEGF) proteins of the invention (see AAW04829, and AAW04831), which promote endothelial or mesodermal cell proliferation. VEGF is also a glycosylated cationic dimer, and is sometimes referred to as vascular permeability factor (VPF). VEGF has diverse effects, depending on the specific biological context in which it is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of angiogenesis in vivo by promoting endothelial cell growth during normal embryonic development, wound healing, and tissue regeneration/recognisation. The VEGF proteins of the invention share the angiogenic and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate angiogenesis in wound healing. Antibodies against the proteins can be used for inhibiting angiogenesis. The antibodies can also be used diagnostically to quantitively detect vEGF-B. Primers complementary to the coding sequences for the proteins of the invention can also be used to detect VEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy specimens may be useful as an influence of metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Endothelial cell; proliferation; vascular endothelial growth factor; VPF; VEGF; endothelium; mesodermal cell; cationic dimer; tissue regeneration; vascular permeability factor; cell mitogen; anglogenesis; cell growth; embryonic development; wound healing; tissue reorganisation; antibody; cancer; metastatic risk; tumour cell; human; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Factor VIII analogue is sufficiently mutated from the original gene that it is not recognised by blood Abs of the patient. The analogue is composed of human FVIII but carries the B-domain of human FV in place of the FVIII B-domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

```
AAT37933-T37946 represent the intron/exon boundaries for the human vascular endothelial growth factor (VBGF) proteins of the invention (see AAW04829, and AAW04831), which promote endothelial or mesodermal cell proliferation. VBGF is also a glycosylated cationic dimer, and is sometimes referred to as vascular permeability factor (VPF). VBGF has diverse effects, depending on the specific biological context in which it is found. VBGF is a potent endothelial cell mitogen, and directly contributes to induction of anglogenesis in vivo by promoting contributes to induction of anglogenesis in vivo by promoting healing, and tissue regeneration/reorganisation. The VBGF proteins of the invention share the anglogenic and other properties of VBGF, but are distributed and expressed in tissues differently to VBGF. The proteins can therefore be used to accelerate anglogenesis in wound healing. Antibodies against the proteins can be used for inhibiting anglogenesis. The antibodies can also be used diagnostically to quantifactively detect VBGF. Became as a sequence of the proteins can be used to detect VBGF. Became of the proteins can be used the detect VBGF. Became of the proteins can be used to detect VBGF. Became of the proteins can be used the detect VBGF. Became of the proteins can be used the detect VBGF. Became of the proteins can be used the detect VBGF. Became of the proteins can be used the detect VBGF. Became of the proteins can be used the detect VBGF. Became of the coding sequences for the proteins can be used the detect VBGF. Became of the coding sequences for the proteins can be used to detect VBGF. Became of the coding sequences for the proteins can be used to detect VBGF. Became of the coding sequences for the proteins can be used to detect VBGF. Became of the coding sequences for the proteins can be used to detect VBGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Quantification of VEGF-B in cancer blopsy specimens may be useful as an indicator of metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences, this is especially useful in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Vascular endothelial growth factor VEGF-B proteins - useful to accelerate angiogenesis in wound healing, also related nucleic acid and antibodies for cancer diagnosis
                                                                                                                                                                                                                                                                                                                       Alitalo K, Eriksson U, Olofsson B, Pajusola K;

Patent No. 6133031

GENERAL INFORMATION:
APPLICANT: Monia, Brett P.
APPLICANT: Gaarde, William A.
TITLE OF INVENTION: Expression
FILE REFERENCE: ISPH-0389

CURRENT APPLICATION NUMBER: US/09/377,310B

CURRENT FILING DATE: 1999-08-19

NUMBER OF SEQ ID NOS: 43

SOFTWARE: PatentIN Ver. 2.0

SEQ ID NO 30

Sequence 487, Application US/08482080A
Patent No. 6010849
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Cantor, Charles R.
APPLICANT: Andrews, Beth M.
APPLICANT: Auriews, Beth M.
APPLICANT: Fry, Kirk E.
TITLE OF INVENTION: Sequence-Directed DNA Binding
TITLE OF INVENTION: 664
NUMBER OF SEQUENCES: 664
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CORTANTOS SISIEM:

PCR primers AAX36327-28 were used to amplify human FAK cDNA, in the course of the invention. The specification describes a method for altering the tumorigenicity or malignancy of brain cancer cells by changing the activity of glycosyltransferase in the cell so that glycosylation of cellular proteins is modified. The method is applied to glicom or meningiona, for prevention or treatment of brain tumours. Measuring the level of glycosyltransferase expression in brain cells is used to detect or predict their tumorigenicity.
                                                                                                                                                                                                                                                                                                                                                                                Human; tumorigenicity; glycosyltransferase;

                                                                                                                                                                                                                                                                                                                                                                                ö
                                               The present invention describes a number of phosphorothioate antisense sequences to the human focal adhesion Kinase (FKK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a number of phosphorothicate antisense sequences to the human focal adhesion kinase (FAK) protein. This protein is involved in integrin-mediated signal transduction, and is implicated in cancer, particularly colon, breast and oral tumours, embryonic development disorders, angiogenic disorders and wound healing. The antisense sequences, including the one shown here, can be used in the treatment of all of these.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense compounds for inhibiting focal adhesion kinase expression, especially useful for inhibiting retinal neovascularization, or for diagnosing and treating e.g. colon cancer
                                                                                                                                                                                                                                                                                                                                                                                Gaps

fibrononectin collagen-binding domain. The amplified sequence was used to construct a collagen-binding physiologically active polypeptide. This polypeptide comprises a peptide from fibronectin ligated to a physiologically active peptide. The polypeptides are used in an agent for enabling topical retention or sustained release of a physiological active peptide or physiological activity-imparting agent. They may be used in gene therapy and in tissue regeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This primer is used for the PCR amplification of guanosine 5-diphospho-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a mammalian PC1 gene and protein, and a set of PC1 biallelic markers. The PG1 polynucleotide and biallelic markers are used in a hybridisation assay, a sequencing assay, or in an allele-specific amplification assay for determining the identity of a nucleotide at a PG1-related biallelic marker. The methods can be used to detect and to assess the risk of developing cancer or prostate cancer. Barly stage diagnosis of prostate cancer relies on prostate specific antigen (PSA) dosage. However, the effectiveness of this is limited due to its inability to discriminate between maligiant and non-maligiant affections of the organ. A need exists for both a reliable diagnostic and curative treatments of the disease. The PG1 gene can be used for detection of prostate cancer, and the risk of developing it in the future, and can also be used to determine therapies for the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fibrononectin; collagen-binding domain; sustained release; gene therapy; physiologically active polypeptide; topical retention; PCR primer; tissue regeneration; ss.

beta L-fucose (GDP-fucose) pyrophosphorylase (GDPFPP) cDNA. Cells can be genetically engineered to contain the GDPFPP nucleic acids and produce the protein. GDPFPP enzymes can be used to synthesise carbohydrate molecules of defined structures, useful in investigating the role of carbohydrates as recognition elements on cell surfaces. They are especially useful in producing donor substrates (e.g. GDP-fucose) in reactions of a glycosyl transferase (e.g. fucosyltransferase) with the substrate, an acceptor sugar and a divalent metal cation to allow formation of glycosyl Iningses adding a saccharide to a substrate saccharide. The proteins can also be used to produce antibodies or antisera useful to characterise, detect and isolate proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A 5' primer (AAT997584) and a 3' primer (AAT997585) were used in the PCR amplification of human GDP-fucose pyrophosphorylase (GDPFPP) cDNA (see AAT97583) from Epstein-Barr virus-transformed B lymphoblastoid cell line JY, and were designed to incorporate EcoRV sites at the 5' and 3' termin of the amplified sequence. The amplified GDPFPP CDNA was subsequently incorporated into expression vectors. Recombinant human GDPFPP was expressed in COS, NSO and Spodoptera frugiperda Sf9 cells. The claimed enzyme (see AAW36811) is useful in the synthesis of carbohydrate structures.
                                                                                                                                                                                                        cross-reacting with the GDPFPP protein.
Note: The specification refers to claimed GDPFPP nucleotide and amino acid sequences, neither of which are given in the specification.
                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensize, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification.

A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                       Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flx. ```
This represents a promoter fragment of the HIV-1 genome that is used as a target sequence. The invention provides polyamide DNA-binding ligands for modulating expression of cellular and viral genes. One method comprises identifying a unique target DNA sequence adjacent to the binding site of a minor groove transcription factor protein (MGTFP), choosing a polyamide having subnanomolar affinity for the target DNA and treating the target DNA with the polyamide as transcription inhibition. Methods (1) for inhibiting replication of a pathogen by administering a transcription-inhibiting polyamide; (2) improving binding affinity of polyamide, selected for an identified viral DNA target by replacing a carboxamide binding pair (CBP) that does not include N-methylimidazole carboxamide (IM) with a CBP comprising paired beta-alanine (beta) residues; (3) inhibiting binding of the zinc finger protein TFIIIA to

ö
the SS ribosomal RNA gene internal control region; (4) for treating adenocarcinoma of ovary, endometrium, breast, fallopian tubes and cervix with the polyamide are also provided. Method (1) is applied to viruses, bacteria, fungi and protozoa, especially human immune deficiency virus (HIV)-1, both therapeutically and for treating blood cells in vitro. Method (4) is especially used against cancers that overexpress the her-2,new oncogene. The polyamide can also be used for diagnosis of disease, very generally as therapeutic agents for any disease involving cellular or viral gene transcription, for genomic sequencing, for DNA capture and for DNA cleavage (oxidative or by light). The polyamide has excellent specificity and very high affinity for the target DNA, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TATA modulating factor, TMF; transcription; TATA box; promoter; HIV-1; human immunodeficiency virus-1; short arm; human chromosome 3; p12-p21;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the TATA region of the HIV-1 LTR from -46 to -1. This region is bound by TATA modulating factor (TMF). TMF is a protein of mol. wt. 123-130 kD which activates transcription in most genes, esp. in human immundeficiency virus-1 (HIV-1) by binding to the TATA box region of the promoter. TMF is encoded by the short arm of human chromosome 3 in the region p12-p21 which is often involved in translocations in patients having lung and other types

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                One application of this method is to encaryotic general transcription factors (e.g. TFIID), where the target region is typically selected from DNA sequences adjacent to the binding site for the encaryotic transcription factor. Numerous exemplary test sequences are given: the sequences in AAQ6921-731 and AAQ69850 correspond to promoter sequences in AAQ6973-849 correspond to promoter that test sequences may also be randomly generated. DNA:protein The test sequences may also be randomly generated. DNA:protein literaction may be used for screening purposes, e.g. the Herpes Simplex AAQ69891).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A DNA protein-binding assay is provided, useful for screening libraries of synthetic or biological cpds for their ability to bind DNA test sequences. The assay is versatile in that any number of test sequences can be tested by placing the test sequence adjacent to a defined protein-binding screening sequence. Binding of mols, to these test sequences changes the binding characteristics of the protein mol. to its cognate binding sequence. When such a molbinds the test sequence, the equilibrium of the DNA:protein complexes is disturbed, generating changes in the concentration of free DNA probe.

                                                                        factors (e.g. TFIID), where the target region is typically selected from DNA sequences adjacent to the binding site for the eucaryotic transcription factor. Numerous exemplary test sequences are given: the sequences in AA069251-731 and AA069850 correspond to promoter targets (typically, TATA box-contg. sites) for human genes and the sequences in AA069732-849 correspond to promoter targets for viral genes. The test sequences may also be randomly generated. DNA:protein interaction may be used for screening purposes, e.g. the Herpes Simplex Virus (HSV) origin of replication and UL9 (see AA069851-52, AA069865 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  A DNA protein-binding assay is provided, useful for screening libraries of synthetic or biological cpds. for their ability to bind DNA test sequences. The assay is versatile in that any number of test sequences can be tested by placing the test sequence adjacent to a defined protein-binding screening sequence. Binding of mols. to these test sequences changes the binding characteristics of the protein mol. to its cognate binding sequence. When such a mol. binds the test sequence, the equilibrium of the DNA:protein complexes is disturbed, generating changes in the concentration of free DNA probe. One application of this method is to eucaryotic general transcription
                                                                                                                                                                                                                                                   DNA protein-binding assay; test sequence; screening sequence; promoter; target; TATA box; Herpes Simplex Virus; HSV; origin of replication; UL9; transcription factor; TFIID: ds.

```
The sequences given in AAT63713-4312 represent duplex DNA's which act as target regions in the method of the invention. The method for altering the binding characteristics of a DNA-binding protein to duplex DNA comprises contacting the duplex DNA with a small molecule which binds sequence-specifically to a target region, where, when the small molecule is bound to the target region, it is adjacent to, but not concentration by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the binding of the DNA binding of the small molecule may inhibit or campounds isolated using this method are potentially useful as the duplex DNA. The binding of the small molecule may inhibit or compounds isolated using this method are potentially useful as the sequence, or inherited genetic disorders etc. The method is suitable for screening large biological or chemical libraries and allows determination of sequence-specific and relative affinities of known DNA-binding agents for different DNA sequences. The design of these duplex DNA's allows a single DNA. PNA binding control or preferential, DNA binding to be used for screening sequence-specific.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to we used tot screening sequence-specific, or preferential, DNA binding proteins that recognise almost any possible sequence (see also AAT49539-74).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

as target regions in Anion 19713-19712 represent dupter DNA sucretaries at target regions in the method of the invention. The method for altering the binding characteristics of a DNA-binding protein to duplex DNA sequence-specifically to a target region, where, when the small binds sequence-specifically to a target region, where, when the small molecule is bound to the target region, it is adjacent to, but not overlapping by more than 4 bp, a binding site for a DNA-binding protein. The small molecule is added at a concentration effective to alter the binding of the DNA binding protein, pref. TFIID, to its binding site on the duplex DNA. The binding of the small molecule may inhibit or enhance the binding of the DNA-binding protein to its binding site. The compounds isolated using this method are potentially useful as therapeutic agents for treatment of any disease which involves a specific DNA sequence, e.g. cancer, or inherited genetic disorders etc. The method is suitable for screening large biological or chemical libraries and allows determination of sequence-specific and relative affinities of known DNA-binding agents for different DNA sequences. The design of these duplex DNA's allows a single DNA-brotein interaction to be used for screening sequence-specific, or preferential, DNA binding proteins that recognise almost any possible sequence (see also AAT49539-
                                                                                                                                                                                           Duplex DNA; target region; binding characteristic; DNA binding protein; TFIID; transcription factor; binding site; inhibition; enhance; cancer; inherited genetic disorder; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAT63713-4312 represent duplex DNA's which act

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 11, Application US/08732612
Patent No. 5922583
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: MORBEY, MOHAMAD A.
TITLE OF INVENTION: METHODS FOR PRODUCTION OF RECOMBINANT
TITLE OF INVENTION: PLASMIDS
NUMBER OF SEQUENCES: 11
CORRESPONDENCE ADDRESS:
ADDRESSEE: MORRISON & FOERSTER
STREET: 2000 PENNSYLVANIA AVE., NW
CITY: WASHINGTON
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
OPPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
FILING DATE: 16-OCT-1996
CLASSIFICATION: 435
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 11.8; DB 2;

US-09-161-015-17/c
Sequence 17, Application US/09161015A
Patent No. 5965370
GENERAL INFORMATION:
APPLICANT: Lex M. Cowsert
TITLE OF INVENTION: ANTISENSE MODULATION OF RhoG EXPRESSION
FILE REFERENCE: RTS-0015
CURRENT APPLICATION NUMBER: US/09/161,015A
CURRENT FILING DATE: 1998-09-25
NUMBER OF SEQ ID NOS: 47
SEQ ID NO 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  18-08-445-289B-25/c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US-09-166-203-9

Sequence 9, Application US/09166203A

Sequence 9, Application US/09166203A

Patent No. 5968826

GENERAL INFORMATION:

APPLICANT: Bennett, C. Frank

APPLICANT: Condon, Tom P.

APPLICANT: CONDON, TOM P.

TITLE OF INVENTION: ANTISENSE MODULATION OF INTEGRIN 4 EXPRESSION

TITLE REFERENCE: ISPH-0323

CURRENT APPLICATION UNMER: US/09/166,203A

CURRENT FILING DATE: 1998-10-05

WOMBER OF SEQ ID NOS: 60

LENGTH: 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
